

Twist Tower

Gallery

Solution

The office building with underground garage is situated in a 15 m long gap site between two houses of the 19th century. To construct a disposition between the old and the new buildings the storeys are twisted against each other. The twisted storeys include the tangent of the road curve counter-rotating in the construction.

From the dumped stair flight next to the main building a gap is created to bring the light from the backyard through the rooms to the front side. The building in the backyard has a smooth transition to the main building. It is an ashlar, set up around 45°, with a gallery unit put on.
